2023 TEXAS STUDENT SYMPOSIUM

**CELF CIVIC SCIENCE
RECAP + IMPACT REPORT**

MARCH 8, 2023
HOUSTON, TEXAS

Hungry for Science

Schools address food

and urbanization?

Innovative Action

CHILDREN'S ENVIRONMENTAL LITERACY FOUNDATION

The Student Symposium is a culminating event from CELF's Civic Science: Inquiry to Action program which engages students in hands-on learning to identify, analyze, and solve real-world environmental issues that impact their schools, neighborhoods, and beyond.

CELf's Student Symposium brings young civic scientists together to share their research projects, data, and solutions for pollution remediation and environmental stewardship with community members, field experts, policymakers, and peers being the primary audiences.

By navigating the connection between science, society, and policy, children are empowered to make a positive impact on our world. Led by classroom teachers trained and supported by CELF, students are transformed into vital global citizens, ready to face tomorrow's challenges head-on.

On March 8, 2023, CELF Texas held its first in-person Student Symposium event where students in the Civic Science program presented place-based action projects. The event was hosted by EDP Renewables at Hess Tower in downtown Houston.

CIVIC SCIENCE: INQUIRY TO ACTION FRAMEWORK

STEP 1 | INQUIRY

Students connect to their place (i.e. campus, classroom, or community) through the development of an **inquiry** question related to an environmental issue they can investigate.

STEP 2 | DATA COLLECTION

Students gather information to support their inquiry question. **Data** will be qualitative and/or quantitative, and collected using devices, technology, tools, surveys, photos, maps, observations, etc.

STEP 3 | ANALYSIS

Students **analyze** trends, patterns, and evidence from the data collected. They formulate a solution to the problem, and determine the environmental, economic, and equity implications.

STEP 4 | COLLABORATION

Students **collaborate** to discuss their findings, share ideas, perspectives, and determine next steps. If they answered the inquiry question, students move to the next step. If not, they identify what additional information is needed and how to address any information gaps.

STEP 5 | INNOVATION

Students collectively use **innovation** and creativity to construct a solution to the inquiry problem. In addition, they devise a remediation plan and decide how best to present their data-based findings and plans to others.

STEP 6 | ACTION

Students create change in their community through awareness, empowerment and civic **action** by presenting their findings to an authentic audience composed of decision-makers and field experts.

STUDENT LEARNING EXPERIENCES

During the 2022/23 school year, CELF provided students with numerous opportunities for discovery and inspiration with programs to complement their Civic Science experience.

Civic Science Introduction

CELF educators joined teachers and students in their classrooms to introduce the core concepts of Civic Science, including the Big Ideas of Sustainability and driving questions. Students used this time to start imagining their final projects.

Green Experiences

Whether exploring the Houston Ship Channel from a boat, cleaning up a lakeside, or identifying species in the wild, students got to see how much of a difference they can make in their local environment.

Data Capture

Using air quality monitors and other technologies, students transformed their outdoor experiences into scientific data gathering for analysis back at school.

Green Careers Speakers

The Green Careers speaker series connects teachers and students with field experts and scientists who enrich the classroom experience by adding real-world exposure and career connection during presentations and Q&A sessions.

CTE High School Students Evaluate Air Quality Along the Houston Ship Channel

PROJECTS OVERVIEW

Channelview ISD and Pasadena ISD students evaluated air quality along the Houston Ship Channel. Teachers and students received training in air quality monitoring techniques and used specialized equipment to collect data on various pollutants such as particulate matter (PM 2.5) and volatile organic compounds (VOCs).

Their varying projects provided valuable information about surrounding air quality, as students identified potential environmental health hazards directly connected to air quality. Their projects promoted scientific literacy among Career and Technical Education (CTE) students and also encouraged active participation in addressing real-world environmental issues.

STUDENT ACTION STEPS:

- Channelview ISD students will connect with a campus in Ghana through CELF's Student Exchange program where students from each campus share an overview of their air quality projects along with exchanging data analysis
- The teachers from this cohort are extending these student projects into the next academic year to evaluate the connection between water and air quality along the ship channel

Investigation of Water Quality in the Rio Grande River Continues in Second Year

PROJECT OVERVIEW

The student group from Rio Grande City CSD traveled over 350 miles to share their second year of data at the Student Symposium. The project involves collecting water samples from three water sources connected to the Rio Grande River - which serves as a vital source of water for communities in both the US and Mexico.

Through this project, students regularly investigate the water quality of their local watershed along the Rio Grande River. The samples are analyzed several times a year to assess the water quality, as well as to identify any pollutants that may be present. They collect water samples from three different locations in the vicinity of Rio Grande City and conduct standard tests to assess and track the turbidity, acidity, salinity, oxygen levels, and bacteria content of the samples.

STUDENT ACTION STEPS:

- Due to the discovery of fecal coliform bacteria at all three sampling sites, students are focused on raising public awareness about this community issue and are looking to present their water findings to their local city council
- These students and teachers are actively fundraising and applying for financial support to ensure the continuation of this campus project. The current lack of resources poses a significant limit on fostering the longevity of the project and the innovation among students

Students Rethink Local Food Systems with Hydroponics, Vertical Gardens and Food Closets

PROJECTS OVERVIEW

This academic year, three campuses from different districts throughout the Greater Houston Area shared projects focused on rethinking local food systems with hydroponics, vertical gardens, and food closets to address food insecurity and waste issues in their communities.

In partnership with Houston-based hydroponics supplier Moonflower Farms, students are implementing alternative methods of growing produce in urbanized areas with limited space. Students are exploring the feasibility of implementing these methods in their schools to increase access to fresh produce for entire campus populations. Other projects have students working to establish and maintain food closets in their community, as a broader systemic way to address food insecurity.

STUDENT ACTION STEPS:

- Students from Shadow Creek High School are actively working with other campuses in the Greater Houston Area to provide access to hydroponic systems
- Students are exploring the feasibility of implementing hydroponics systems to regularly increase access to fresh produce for entire campus populations

Students Inspect Indoor Air Quality on Campuses

PROJECTS OVERVIEW

With access to air quality devices - such as the AirBeam and Flow - middle and high school students examined different factors influencing indoor air quality on their school campuses. These projects allow students to consider the interconnection between indoor and outdoor air along with the different contributing factors to air quality.

One group of students focused on the impact of school-provided and commercially acquired hand sanitizers; another examined the air quality and developmental health effects of high school welding programs; while a third investigated the influence of an idling bus fleet at the entrance of the school.

STUDENT ACTION STEPS:

- For Endeavor HS, this indoor project is being implemented as a legacy project - graduating students are establishing parameters and providing a structure of longevity for the next wave of students inheriting this project
- For the other campuses, the air quality project findings are being used to petition campus administrations, district-level decision-makers, and school boards to reconsider the purchasing of soaps and hand sanitizers containing chemicals that could negatively impact the health and safety of students

Middle School Students Explore Houston's Water Quality

Water Filters

Driving question:
What type of filter can best be used to purify water so that it's safe to drink?

DATA: We made three water filters and tested them.

- Filter 1 is made of a water bottle, cotton, a coffee filter, and sand
- Filter 2 is made out of a 2 liter coke bottle, cotton, a coffee filter.
- Filter 3 is made out of pebbles, charcoal, sand, cotton, 2 liter coke bottle, and rocks

PLACE:

Testing the pH of Waters From Houston MUD Districts

-Guiding Question-
Due to the boiling water notice in Houston we wanted to test out some of the waters in the MUD Districts of Houston to see if the waters are within healthy levels?

-Collaboration-
The MUD Districts of Houston that we tested, had different pH levels; therefore, that helped us come to our conclusion.

-Data Collection-
North Green came out with a pH of 4 which is the most acidic water out of all the waters that we tested. The school water which came out with a pH of 8 is the most natural and the best water out all the waters we tested. Mud 69 came out with a pH of 5, which not that bad but is acidic. Private Managed water by Montgomery County came out distinct from the rest of the waters we tested because it came out clear.

-Analysis-
We thought that MUD District 69 was going to be the most healthiest water. We learned that the school water, which is from the City of Houston, turned out to be the healthiest water.

-Innovation-
After completing our project, we found out that some of the waters tested were found to be acidic.

-Action-
The next step in our project is to collaborate with the MUD Districts and discuss the different pH levels that we obtained.

Finding out water quality in rivers around Houston, TX

Driving question
Can you sustain yourself by drinking water from rivers for the rest of your life?

Student: Jacob Lopez
Student: Ashley Rivero
Lewis Middle school
6th grade
Teacher: Michael Arratia
Texas

Information
People drink water expecting to be hydrated and healthy. What people don't know is what is in the water so they drink it. This could kill them slowly without realizing. Things like Mercury and Iron can harm your body without knowing until it happens.

San Jacinto **Spring Creek** **Jesse Jones**

WQL WITH COMMON DRINKS

Driving Question: What common drinks are harmful to pregnant women?

Future Collaborations: Aldine Health Services, USGS

Indoor Factors: Purely water quality testing kit

Data: As you can see in the chart, most of these drinks that are sold and consumed every day. These drinks contain very toxic ingredients like lead. If consumed at an extreme level, these drinks could lead to kidney failure.

	Red Bull	Pura Life Water	Dr. Pepper	Apple Juice
Lead	0	15	15	15
Fluoride	12	50	0	W
Sodium Chloride	50	40	50	50
Zinc	10	0	0	5

Place: Lewis Middle School, From Aldine ISD, Testing was done inside a classroom.

Presented By: Karla Guardado
Teacher: Michael Arratia

PROJECTS OVERVIEW

At Lewis Middle School, a teacher and frequent CELF program participant led his students through projects aimed at understanding Houston's water quality. Their projects centered around the efficacy of using water filters and testing the pH of waters from different Houston water suppliers to explore the water quality in the region's rivers.

LEWIS
MIDDLE SCHOOL

In these projects, students conducted research on the importance of water quality and evaluated the factors that affect it - including the presence of pollutants, contaminants, and pH levels. Project research included the sources of water in Houston, including rivers, reservoirs, and groundwater. Students evaluated water put through filters to test the pH of water from Houston MUD (Municipal Utility District) districts. MUD districts are independent governmental entities that provide water, sewer, and other utility services to residents within their boundaries. By testing the pH levels of water from different MUD districts, students compared and contrasted the quality of water in different areas of Houston.

STUDENT ACTION STEPS:

- At CELF's 2023 Summer Institute, the teacher leading this project will model multi-year Civic Science projects for other teachers
- The teacher is planning to lead students in collecting water samples from different rivers around Houston, such as the Buffalo Bayou and the Brazos River
- Students will use the water sample results to present to Harris County Water Control and Improvement Districts, as well as the United States Geological Survey

SYMPOSIUM PARTNERS & SPONSORS

LOOKING FORWARD

Are you interested in bringing Civic Science and a Student Symposium to your school, district or community?

Contact CELF about bringing Civic Science and its related programs to students in your community.

Each year, Civic Science grows with more **multi-year projects and innovative pathways**. CELF's 2023-24 program will include a pathway focus on water quality, watershed health and coastal resilience.

At CELF, we look ahead to deepening relationships with schools and partners, including Port Houston support of student research on the Houston Ship Channel.

With immense gratitude to everyone who helped make this day a success!
